Reflection of the Project Phoenix

The hardest part for me was seeing that the CEO didn't read or act on the urgent email, even though it clearly explained the breach. In class, we are all IT students, so we are used to thinking in technical language, but she didn't, and the email wasn't the right way to communicate something this serious. In the original communication, the form (written email) and channel (email) didn't match the function, so the message didn't get through. Employees were left in the dark, and the public found out on social media, which made things worse. If this happened in real life, I would call the CEO immediately and then send a short, simple note explaining what happened and what she needs to do. This way, everyone would understand quickly, act fast, and we could prevent more problems.
